## Warning

Gates Europe N.V. recommends industrial hoses for normal service as described in this catalogue. Other applications should be referred to your respective marketing representative.

**In any application, there may be inherent risk of bodily injury or property damage and the user is responsible for implementation of adequate safety precautions. It is the responsibility of the person supplying the hose to advise the user of proper instructions for the adequate safe use and/or precautions and to warn the user of consequences of failure to heed such instruction. Should a hose assembly fail during use because of excessive pressure, injurious and/or damaging chemicals, elevated temperature materials, explosives or flammable materials, then serious bodily injury or destruction of property could result from impelled couplings, whipping hoses, high pressure or high velocity discharge, chemical contact, high temperature materials, explosion or fire.**

In known high risk areas, it is recommended that hose inspections be performed at frequent intervals related to the risk factor. Hoses with obvious damage should be scrapped and replaced. These inspections should include tube and cover conditions, leaking or slipped couplings and proof test.

### **IMPORTANT**

Gates recommends only those applications of products specified in Gates product literature. Gates disclaims any liability for use of its products in applications other than those for which they were designed.

## Service Life

All rubber products, including Industrial Hose assemblies, have a limited life on a given application. Assuming the correct hose has been selected for the application, this service life can be adversely affected by many variable conditions. The major ones are:

- Exposure to severe external abuse such as kinking, bending, high end pull, crushing or abrasion.
- Exposure to higher-than-rated working pressures or to high surge pressures.
- Exposure to higher-than rated temperatures.
- Misapplication or exposure to corrosive liquids or gases outside the range of suitable applications.

1. **External abuse** – Hoses should be placed where they will not be run over by equipment or subjected to high end pull. Hoses should not be bent below recommended minimum bend radius. This could result in kinking the hose or reducing its pressure resistance. Large diameter hoses also may require additional support to reduce external abuse.
2. **Hose & System Pressures** – In establishing and determining pressures related to hoses and the systems to which they are applied, it is necessary to consider separately the characteristics of the hose and the system.
  - The system (or device or application) can have several pressures depending on pressure sources and surges imposed by the operator or mechanical components.
  - A given hose has a fixed characteristic with respect to the pressure it can withstand (and how it is applied) and still gives satisfactory life.
3. **High Temperatures** – The allowable temperature ranges for industrial hoses are shown on each data page. These are for product temperatures and should not be exceeded. High temperatures can degrade rubber stocks very quickly resulting in short service life. Where external temperatures are higher than normal ambient, contact your Gates field representative for recommendations.
4. **Misapplication** – All industrial hoses are designed for a certain specific application or related application. They should not be used for any other applications.
5. **Hose Information** – Refer to the following pages for details of hose construction and physical characteristics. These are shown in the data pages and include such items as rated working pressure, minimum bend radius and static conductivity ratings.
6. **Internal Abrasion** – For applications of a highly abrasive nature where the hose makes one or more bends, the hose should be rotated 90° periodically to lengthen service life. The hose manufacturer established, through design and testing, the recommended rated working pressure for the hose. It is the responsibility of the user to accurately determine the system pressure. Steady state pressure can be measured readily by gauges. Surges are difficult to measure and may require the use of electronic pressure pickup devices. Also, surge values depend on so many variables that a series of tests are usually required to obtain a valid set of readings. However, if there are extreme surges in the normal operation, or if there is the likelihood of abnormal operation of the system, the magnitude must be determined. Considering the recommended rated working pressure of the HOSE and the various pressures of the SYSTEM, the hose is matched to the system using proper application engineering principles.

## Proper hose selection

Proper hose selection is the first step in preventive maintenance. Selecting the best product for the application will allow you to obtain the maximum life expectancy from the product for the best value.

When selecting the correct hose, use the acronym **STAMPED** as your guide:

**S = Size**

I.D. (Inside Diameter)  
O.D. (Outside Diameter)  
Based on the machinery sizing.

**T = Temperature**

Consider exterior and interior temperature, as well as temperature impact on the material being conveyed.

**A = Application**

Where will the hose be used?  
How will the hose be used?  
How often will the hose be used (continuous, intermittent, seldom)?  
What are the environmental conditions?  
Special hose construction (crush resistance)?  
Conductivity requirements?  
Is the hose used in a critical application?  
Government or Industrial Standard requirements?  
Use hoses that are specifically designed for these applications:  

- Steam
- LP Gas
- Aircraft Ground refuelling
- Corrosive Chemicals

**M = Material being conveyed** Chemical name(s) and state(s) – (liquid, solid or gas, concentration)  
Food  
Dry or powder  
Liquid

**P = Pressure**

What is the working pressure?  
What is the maximum surge pressure?  
Is there a vacuum?

**E = End requirements**

What type of thread ends?

**D = Delivery**

Identify how many items and when they need to be supplied.  

- Distributors – Call Customer Service.
- End Users – Call Distributors.

## Homologation icons

FDA (US Food and Drug Administration) is an agency within the Department of Health and Human Services and consists of centers and offices. The FDA is responsible for protecting the public health by assuring the safety, efficacy, and security of human and veterinary drugs, biological products, medical devices, our nation's food supply, cosmetics, and products that emit radiation.

The Federal Institute for Risk Assessment (BfR) is active in the field of consumer health protection. Its tasks include the assessment of existing and the identification of new health risks, the drawing up of recommendations on risk reduction, and the communication of this process.

The United States Pharmacopeia (USP) is a non-governmental, official public standards-setting authority for prescription and over-the-counter medicines and other healthcare products manufactured or sold in the United States. USP also sets widely recognized standards for food ingredients and dietary supplements. USP sets standards for the quality, purity, strength, and consistency of these products – critical to the public health.

A hose which is capable of discharge is a hose with a resistance of more than  $10^3 \Omega/m$  and less than  $10^6 \Omega/m$  and is indicated with an  $\Omega$  icon. An object or device is capable of discharge if its surface resistance is between  $10^4 \Omega$  and  $10^9 \Omega$  measured at  $23^\circ C$  and 50% relative humidity. The characteristic of being able to discharge is also referred to as being "anti-static".

Animal Derived Ingredients (ADI) can cause the disease BSE and should therefore be avoided in products that may come into contact with products that are intended for human consumption. Hose liner material ingredients and process aids can contain ADI. GATES has therefore checked the compound portfolio and can now offer a broad selection of ADI free food and beverage hoses.

#### RECOMMENDED FOR

Premium pressure hose (D) for mineral oil products and fuel mixtures with a maximum 50% aromatic content. Ideal for offshore/onshore transfer applications involving discharge service for diesel oils and other similar petroleum products where an extremely lightweight, flexible hose with a high rated working pressure and a small minimum bend radius is required.

#### TUBE

Black NBR1 rubber, smooth and oil resistant

#### REINFORCEMENT

High tensile synthetic textile cord, two crossing anti-static wires

#### COVER

CR rubber, black, smooth with cloth impression, good resistance to weather and abrasion, chemical and oil resistance

#### TEMPERATURE

-30°C to +90°C

#### BURST PRESSURE

4 x WP

#### ELECTRICALLY CONDUCTIVE

R < 10<sup>6</sup> Ohm

#### STANDARDS

EN 12115, EN 1761

#### BRANDING TRANSFER LABEL

PREMIUM™ FUEL MASTER D - EN 12115/ EN 1761 FUEL TRANSFER 20 BAR Ω

\*\* Vacuum resistance up to -0.9 bar

#### RECOMMENDED FOR

Vacuum and pressure hose (SD) for transfer of fuel oil and other petroleum based products in home delivery, commercial and industrial service or in low pressure return lines. Transfer of refined fuels (commercial gasoline and diesel fuel), oils and other petroleum products. Ideal for oilfield service truck use. Service life of transfer hoses can be extended by draining hoses after use. Max 50% aromatic content.

#### TUBE

Black NBR rubber, smooth and oil resistant

#### REINFORCEMENT

High tensile synthetic textile cord, steel wire helix, two crossing anti-static wires

#### COVER

CR rubber, black, smooth with cloth impression, good resistant to weather and abrasion, chemical and oil resistance

#### TEMPERATURE

-30°C to +100°C

#### BURST PRESSURE

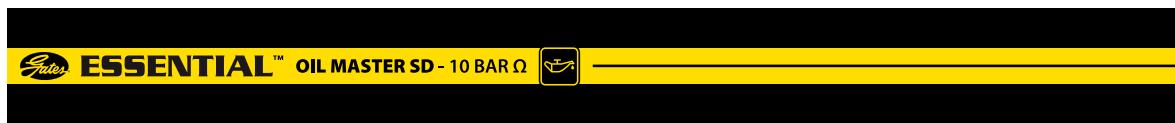

> 30 bar

#### ELECTRICALLY CONDUCTIVE

R< 10<sup>6</sup> Ohm

#### BRANDING TRANSFER LABEL

#### RECOMMENDED FOR

Premium delivery hose (D) for handling a variety of chemical products such as acids, alkalis, esters and ketones with a medium or low concentration. Tank truck, barge, ship, or storage tank transfer of a variety of mild chemical products.

#### TUBE

Black EPDM, smooth, conductive

#### REINFORCEMENT

High tensile synthetic textile cord with crossing anti-static wires

#### COVER

CSM rubber , black, superior resistance to weather and abrasion, excellent chemical and oil resistance

#### TEMPERATURE

-40°C to +95°C

#### BURST PRESSURE

4 x WP

#### ELECTRICALLY CONDUCTIVE

R<  $10^6$  Ohm

\*\* Vacuum resistance up to -0.9 bar

#### RECOMMENDED FOR

Tank truck, barge, ship, or storage tank transfer of a variety of chemical products. STALLION® has a wire helix for full suction capability. The tube stock (Teflon\* or Neoflon\*\*) has excellent chemical resistance and is backed by Gates Gatron™ for flex fatigue safety at the coupling. STALLION® is designed for easy cleaning in a bath containing 10% (NaOH) @ 212°F (100°C). Cleaning in place (CIP) methods may be used. Applications include most basic chemicals which are building blocks for numerous chemicals used in a variety of industries. Compatible with commercially available Bio-Diesel fuels up to B-100.

#### TUBE

Type T (FEP) Teflon\* or Neoflon\*\*. White. Backed with Gatron™ (Modified XLPE)

#### REINFORCEMENT

Synthetic, high tensile textile with steel wire helix

#### COVER

Type P (EPDM). Blue corrugated with red spiral stripe

#### TEMPERATURE

-40°C to +149°C normal service. STALLION® is designed to withstand fluid temperatures to +149°C, however the rating is dependent on the specific chemical conveyed.

#### BURST PRESSURE

55 Bar

#### RECOMMENDED FOR

Premium hose construction for filling and discharge in milk tanker applications.

#### TUBE

NR based white food quality rubber

#### REINFORCEMENT

Synthetic, high tensile textile, 2 steel wire helix

#### COVER

NR based rubber, blue.

#### TEMPERATURE

-30°C to +70°C, intermittent up to +120 °C/ 20 minutes for cleaning

#### BURST PRESSURE

> 18 Bar

#### STANDARDS

FDA, BfR, animal derived ingredient free

#### BRANDING TRANSFER LABEL

#### RECOMMENDED FOR

Premium multi-purpose hose for air and water applications requiring maximum flexibility in any industry, including mining, construction, agriculture, vehicle repair and in-plant operations. Outstanding resistance to heat and ozone. Suitable for light agricultural spraying, such as dilute solutions of herbicides.

#### TUBE

Black EPDM, smooth

#### REINFORCEMENT

Textile layers, spiraled

#### COVER

EPDM rubber, smooth with 1 blue extruded longitudinal stripe

#### TEMPERATURE

-40°C to +100°C

#### BURST PRESSURE

4 x WP

#### ELECTRICALLY CONDUCTIVE

R<10<sup>6</sup> Ohm

### RECOMMENDED FOR

Handling mixtures of oxygen, helium and nitrogen gases customarily used in diving applications as air breathing hose. The kink resistance hose is designed for extra long wear under normal operating use.

### TUBE

NBR black

### REINFORCEMENT

Braided, high tensile synthetic textile cord

### COVER

Neoprene, black. All sizes are perforated

### TEMPERATURE

-40°C to +49°C continuous service

### STANDARDS

Meets MIL-H-2815G Section 3.12.2 off-gassing for air breathing applications, especially diving

### BRANDING TRANSFER LABEL

ESSENTIAL™ CONCRETE MASTER D - 40 BAR

# Care and Maintenance of Hoses

(Reprinted From RMA Hose Handbook)

Hoses have a limited life and the user must be alert to signs of impending failure, particularly when the conditions of service include high working pressures and/or the conveyance or containment of hazardous materials. The periodic inspection and testing procedures described here provide a schedule of specific measures which constitute a minimum level of user action to detect signs indicating hose deterioration or loss of performance before conditions leading to malfunction or failure are reached.

**SAFETY WARNING:** Failure to follow properly the manufacturer's recommended procedures for the care, maintenance and storage of a particular hose might result in its failure to perform in the manner intended and might result in possible damage to property and serious bodily injury.

General instructions are also described for the proper storage of hoses to minimize deterioration from exposure to elements or environments which are known to be deleterious to rubber products. Proper storage conditions can enhance and extend substantially the ultimate life of hose products.

## General Care and Maintenance of Hoses

Hoses should not be subjected to any form of abuse in service. It should be handled with reasonable care. Hoses should not be dragged over sharp or abrasive surfaces unless specifically designed for such service. Care should be taken to protect hoses from severe end loads for which the hose or hose assembly were not designed. Hoses should be used at or below its rated working pressure; any changes in pressure should be made gradually so as to not subject the hose to excessive surge pressures.

Hoses should not be kinked or be run over by equipment. In handling large size hoses, dollies should be used whenever possible; slings or handling rigs, properly placed, should be used to support heavy hoses used in oil suction and discharge service.

## General Test and Inspection Procedures for Hoses

An inspection and hydrostatic test should be made at periodic intervals to determine if a hose is suitable for continued service.

A visual inspection of the hose should be made for loose covers, kinks, bulges or soft spot which might indicate broken or displaced reinforcement.

The couplings or fittings should be closely examined and, if there is any sign of movement of the hose from the couplings, the hose should be removed from service.

The periodic inspection should include a hydrostatic test for one minute at 150 percent of the recommended working pressure of the hose. An exception to this would be woven jacketed fire hoses. During the hydrostatic test, the hose should be straight, not coiled or in a kinked position.

Water is the usual test medium and, following the test, the hose may be flushed with alcohol to remove traces of moisture. A regular schedule for testing should be followed and inspection records maintained.

**SAFETY WARNING:** Before conducting any pressure tests on hoses, provision must be made to ensure the safety of the personnel performing the tests and to prevent any possible damage to property. Only trained personnel using proper tools and procedures should conduct any pressure tests.

1. Air or any other compressible gas must never be used as the test media because of the explosive action of the hose should a failure occur. Such a failure might result in possible damage to property and serious bodily injury.

2. Air should be removed from the hose by bleeding it through an outlet valve while the hose is being filled with the test medium.

3. Hoses to be pressure tested must be restrained by placing steel rods or straps close to each end and at approximate 10 foot (3 m) intervals along its length to keep the hose from "whipping" if failure occurs. The steel rods or straps are to be anchored firmly to the test structure but in such a manner that they do not contact the hose which must be free to move.

4. The outlet end of the hose is to be bulwarked so that a blown-out fitting will be stopped.

5. Provisions must be made to protect testing personnel from the forces of the pressure media if a failure occurs.

6. Testing personnel must never stand in front of or behind the ends of a hose being pressure tested.

7. When liquids such as gasoline, oil, solvent, or other hazardous fluids are used as the test fluid, precautions must be taken to protect against fire or other damage should a hose assembly fail and the test liquid be sprayed over the surrounding area.

## Hose Cleaning

There are many different methods used to clean hose assemblies. An apron, safety glasses or face shield, rubber boots and gloves should be worn to help protect the person doing the cleaning from potential injury. Some suggested methods for select hoses in this catalogue are listed below. Which method to use and how often cleaning should be performed is based on the following:

- Type of hose
- Residual material in the hose
- Cleanliness requirements for the application
- Cleaning facilities available
- Consideration for disposal of the residual material and cleaning solution(s)
- Requirements for special applications such as foods, pharmaceuticals, etc.

## Solution Recommendations

1. Cleaning solutions should be chosen that will dissolve or remove the residual material without damaging the hose assembly.
2. A dilute solution of soap in water can often be sufficient. CAUTION – Some chemicals, such as concentrated acids or bases, can react with water releasing heat and byproducts, and possibly splatter.
3. Consult the MSDS of the material being cleaned to identify potential cleaning solutions.
4. After identifying potential cleaning solutions, check Chemical Resistance Table in this catalogue for compatibility with hose tube and cover.
5. Non-compatibility of a cleaning solution can cause damage to the hose.

## Flushing or Immersing in a Cleaning Bath

1. Do not exceed the maximum working pressure or temperature for the hose.
2. The cover of the hose should also be washed or wiped to remove any residual material.

## Steam Cleaning

1. Steam cleaning is not generally recommended. High temperatures can accelerate aging of a hose and shorten service life.
2. Do not exceed the maximum temperature rating of the hose. Doing so can cause defects such as tube delamination (reducing tube to reinforcement adhesion), tube cracking or tube flow leaving thin spots.
3. Never use superheated steam! This will exaggerate the potential damages noted above. Only "open end" 50 psi steam should be used.
4. If the hose has blockage, remove it before introducing steam.
5. If the steam source has a wand attached, use caution inserting the wand so that physical damage to the hose is not caused. Sharp edges on the wand can cut the tube, and thin spots could occur where the hot wand contacts the tube.

## Shuttle Method

1. This is not a recommended cleaning method for hose assemblies.
2. This method uses a shuttle to travel through the inside of the hose assembly to wipe residual material from the hose. The shuttle and residual material can come out of the hose at velocities that could cause injuries or damage.
3. There is also danger from a build up of pressure if the shuttle becomes lodged.
4. The shuttle can cause damage to the hose tube.

## Recommended Cleaning of Chemical Hoses

1. Drain the hose after each use.
2. Flush with water or other neutralizing cleaning solution.
3. Properly dispose of drained fluid and cleaning waste.
4. Between uses, store the hose in a clean, dry environment away from sunlight.
5. Avoid cross contamination. Dedicate a hose to handle a specific chemical.

## Recommended Cleaning of Food Hoses

1. Drain the hose after each use.
2. Flush with water or other cleaning solution.
3. Properly dispose of drained material and cleaning waste.
4. Between uses, store the hose in a clean, dry environment away from sunlight.
5. Avoid cross contamination. Dedicate a hose to handle a specific food material.

## Storage

Rubber hose products in storage can be affected adversely by temperature, humidity, ozone, sunlight, oils, solvents, corrosive liquids and fumes, insects, rodents and radioactive materials.

The appropriate method for storing hoses depends to a great extent on its size (diameter and length), the quantity to be stored and the way in which it is packaged. Hoses should not be piled or stacked to such an extent that the weight of the stack creates distortions on the length stored at the bottom.

Since hose products vary considerably in size, weight and length, it is not practical to establish definite recommendations on this point. Hoses having a very light wall will not support as much load as could a hose having a heavier wall or a hose having a wire reinforcement. Hoses which are shipped in coils or bales should be stored so that the coils are in a horizontal plane. Whenever feasible, rubber hose products should be stored in their original shipping containers, especially when such containers are wooden crates or cardboard cartons which provide some protection against the deteriorating effects of oils, solvents and corrosive liquids; shipping containers also afford some protection against ozone and sunlight.

Certain rodents and insects will damage rubber hose products and adequate protection from them should be provided. Cotton jacketed hoses should be protected against fungal growths if the hose is to be stored for prolonged periods in humid conditions in excess of 70 percent.

The ideal temperature for the storage of rubber products ranges for 50° to 70°F (10-21°C) with a maximum limit of 100°F (38°C). If stored below 32°F (0°C), some rubber products become stiff and would require warming before being placed in service. Rubber products should not be stored near sources of heat, such as radiators, base heaters, etc., nor should they be stored under conditions of high or low humidity.

To avoid the adverse effects of high ozone concentration, rubber hose products should not be stored near electrical equipment that may generate ozone or be stored for any lengthy period in geographical areas of known high ozone concentration. Hoses should not be stored in locations where the ozone level exceeds the National Institute of Occupational Safety and Health's upper limits of 0.10 ppm. Exposure to direct or reflected sunlight – even through windows – should also be avoided. Uncovered hoses should not be stored under fluorescent or mercury lamps which generate light waves harmful to rubber.

Storage areas should be relatively cool and dark, and free of dampness and mildew. Items should be stored on a first-in, first-out basis, since even under the best of conditions, an unusually long shelf life could deteriorate certain rubber products.

## Hose Finder

Rubber hoses are used basically to convey material. They are used for a variety of reasons, but principally for:

- Flexibility; allows for changes in alignment, hookup or outlet.
- Absorbing vibration.
- Resistance to Corrosive fluids.
- Resistance to abrasion.
- Providing a closed system.

In applying any product, the more you know about the application, the better the product you choose to meet the needs of the application. This is particularly true with hoses because of the many variables involved.

Each type of hose and coupling is designed to give satisfactory, safe service life for a particular application. To obtain this service life, the user should:

- Select the proper hose and couplings for the application.
- Take reasonable care of the hose assembly while it is in service.
- Maintain the hose assembly in good working condition.
- Observe all applicable safety regulations.

If a hose assembly was incorrectly selected to solve an application problem, there is very little that care and maintenance can do to prolong its service life. It's very simple: hoses will fail soon regardless of the care and maintenance provided if they are misapplied.

When designing a system with rubber hoses, engineering principles regarding materials always apply. Take advantage of the outstanding characteristics of rubber materials listed on the Characteristics and Resistance Information for Hose Tube and Cover Compounds page and avoid those conditions that shorten hose life. Some of these conditions are:

- Exposure to higher-than-rated temperatures.
- Exposure to severe external abuse such as kinking, pulling, excessive bending.
- Exposure to corrosive fluids to which hoses have little resistance.
- Subjecting hose to higher than rated working pressure/high surge pressure.

The process of selecting hoses from Industrial Hose Products usually is resolved in one of two ways:

- Making the optimum choice from several possible selections for an application.
- Making the only choice, which satisfies all the requirements of a somewhat special application; i.e., transfer of LP Gas.

Hoses are versatile, and it's often possible to use one type of hose for several different applications. However, certain specific applications are critical and/or hazardous, and the only type of hose used should be the one Gates recommends for that application. Some of the critical or hazardous applications involving hoses are:

- Steam.
- Liquid Petroleum Gas (LPG).
- Corrosive chemicals.
- Air Drill operation.

Refer to the product description pages in this catalogue for details of hoses used in these applications.

The Data Pages are intended to give you a reference for quickly locating standard line hoses for a given application. Hoses are listed by size (I.D.) and rated working pressure. Pertinent specification information is also provided for each hose.

### Precautionary Notes

**Not all of the sizes shown are stock items and may require minimum order quantities. In addition, many of the larger diameter hoses (water, material handling, etc.) are made to order.**

## Gates Chemical Rating System

**NOTE:** Ratings are for the effect on the **polymer only**.

**"1" Preferred: Constant Contact** – This chemical is expected to have minor or no effect on the Polymer. Hose approved for continuous contact. Environmental changes such as temperature, concentration, etc., may promote increased degradation.

**"2" Acceptable: Intermittent Contact** – This polymer should give reasonably satisfactory service. Due to the nature of this chemical, and under prolonged continuous exposure, the rubber may show minor to moderate deterioration and/or solution discoloration. Hose intended for transfer service only. Environmental changes such as temperature, concentration, etc., may promote increased degradation.

**"X" Not Recommended** – The polymer is unsatisfactory for this chemical and should not be used.

**"-" (Dash)** – Insufficient or no data available for this material. Testing is advised.

**NOTE 1.** The above ratings as applied to the Chemical Resistance Table are intended as guides only. They are compiled from the best data available to us. Ratings shown in the table are based on 100% concentrated or saturated solutions, unless otherwise noted, and up to 100 F (+38°C), unless otherwise stated.

**NOTE 2.** If unusual conditions exist, a polymer test in the fluid is suggested.

**NOTE 3.** Where a chemical listed in the Resistance Table is soluble in a solvent other than water, the solvent should also be checked for its suitability with the polymer.

**NOTE 4.** Discoloration of fluids conveyed in the hose. There are no generally accepted standard tests for measuring or rating discoloration of fluids passing through a hose. The amount of discoloration that can be tolerated is usually established by the user on the basis of application. Obviously, products such as paint must be conveyed through a hose that has very good non-discoloring characteristics. If the product is not visually affected, then the hose is satisfactory. For some products, the discoloration may be objectionable from a visual standpoint. Also, the concentration of the particles causing the discoloration may be objectionable if they affect the final use of the product.

Some of the more common methods of checking discoloration are:

1. Allowing the fluid to remain in a sample piece of hose for a specific period and expected operating temperature, then inspecting visually for discoloration.
2. Testing fluid as in No. 1 above and then passing it through filter paper to check foreign content.
3. A more refined test can be made with a spectrophotometer. This instrument measures light transmission through the fluid before and after immersion tests with rubber stocks. This gives a relative rating expressed in percent, the original fluid being rated at 100%.

If discoloration of the product becomes a serious problem for a specific application, contact Gates Europe N.V. for a recommendation.

**NOTE 5.** Fluid permeation through the tube wall needs to be considered. A tube material may show no sign of degradation, however hose failure can occur if material permeates through the tube to degrade adhesive layers or reinforcement.
